

User Manual

1. System Setup

Before running the application, ensure that the following software is installed on your system:

- Python 3.11 or above
 - Visual Studio Code (Recommended)
 - Git
 - Internet connection (for Gemini API and Wikipedia API)
-

2. Clone the Repository

Open a terminal and clone the GitHub repository.

```
git clone https://github.com/<your-username>/Personalised_ai_Assistant.git
```

Navigate to the project directory.

```
cd Personalised_ai_Assistant
```

3. Create a Virtual Environment

Create a Python virtual environment.

Windows

```
python -m venv venv
```

Linux/macOS

```
python3 -m venv venv
```

4. Activate the Virtual Environment

Windows

```
venv\Scripts\activate
```

Linux/macOS

```
source venv/bin/activate
```

5. Install Required Packages

Navigate to the backend folder.

```
cd backend
```

Install all dependencies.

```
pip install -r requirements.txt
```

6. Configure Environment Variables

Create a `.env` file inside the `backend/app` directory.

Add the following environment variable:

```
GEMINI_API_KEY=your_gemini_api_key
```

Replace `your_gemini_api_key` with your actual Gemini API key.

7. Run the FastAPI Backend

Start the backend server.

```
uvicorn app.main:app --reload
```

The backend will be available at:

```
http://127.0.0.1:8000
```

Swagger API documentation:

```
http://127.0.0.1:8000/docs
```

8. Run the Streamlit Frontend

Open a new terminal.

Navigate to the frontend directory.

```
cd frontend
```

Run the Streamlit application.

```
streamlit run app.py
```

The frontend will open at:

```
http://localhost:8501
```

User Guide
